BUSINESS SOFTWARE REFERENCE

Akaunting

Software overview & accounting workflow

A practical guide to the modules, everyday transactions, reports and optional accounting apps.

FEATURE TREE / ACCOUNTING TREE / WORKED EXAMPLES

Prepared for Judibas product discussion

Research checked: 20 October 2026
PDF guide + editable Word document

> Based on public official documentation. The private contents, installed apps and subscription of your Akaunting account have not been inspected. This is an independent guide, not an official Akaunting manual.

01 / What the software does

Akaunting brings customer billing, supplier costs, money movements and financial visibility into one business application. The cloud application is reached through app.akaunting.com. A self-hosted edition is also available. [1, 18, 19]

How to read this guide

Pages	Contents
3-4	Feature tree and the accounting workflow tree
5-7	Sales, purchases and bank transactions
8-9	Accounting records, cash/accrual and financial reports
10-12	Access, settings, optional apps and integrations
13-14	Worked example, operating checklist and terminology
15	Official source links

> **Availability labels:** [F] documented platform function; inclusion and limits depend on edition/plan. [A] separate app or app-dependent capability. [E] illustrative example or recommended working practice, not a claim about a particular screen.

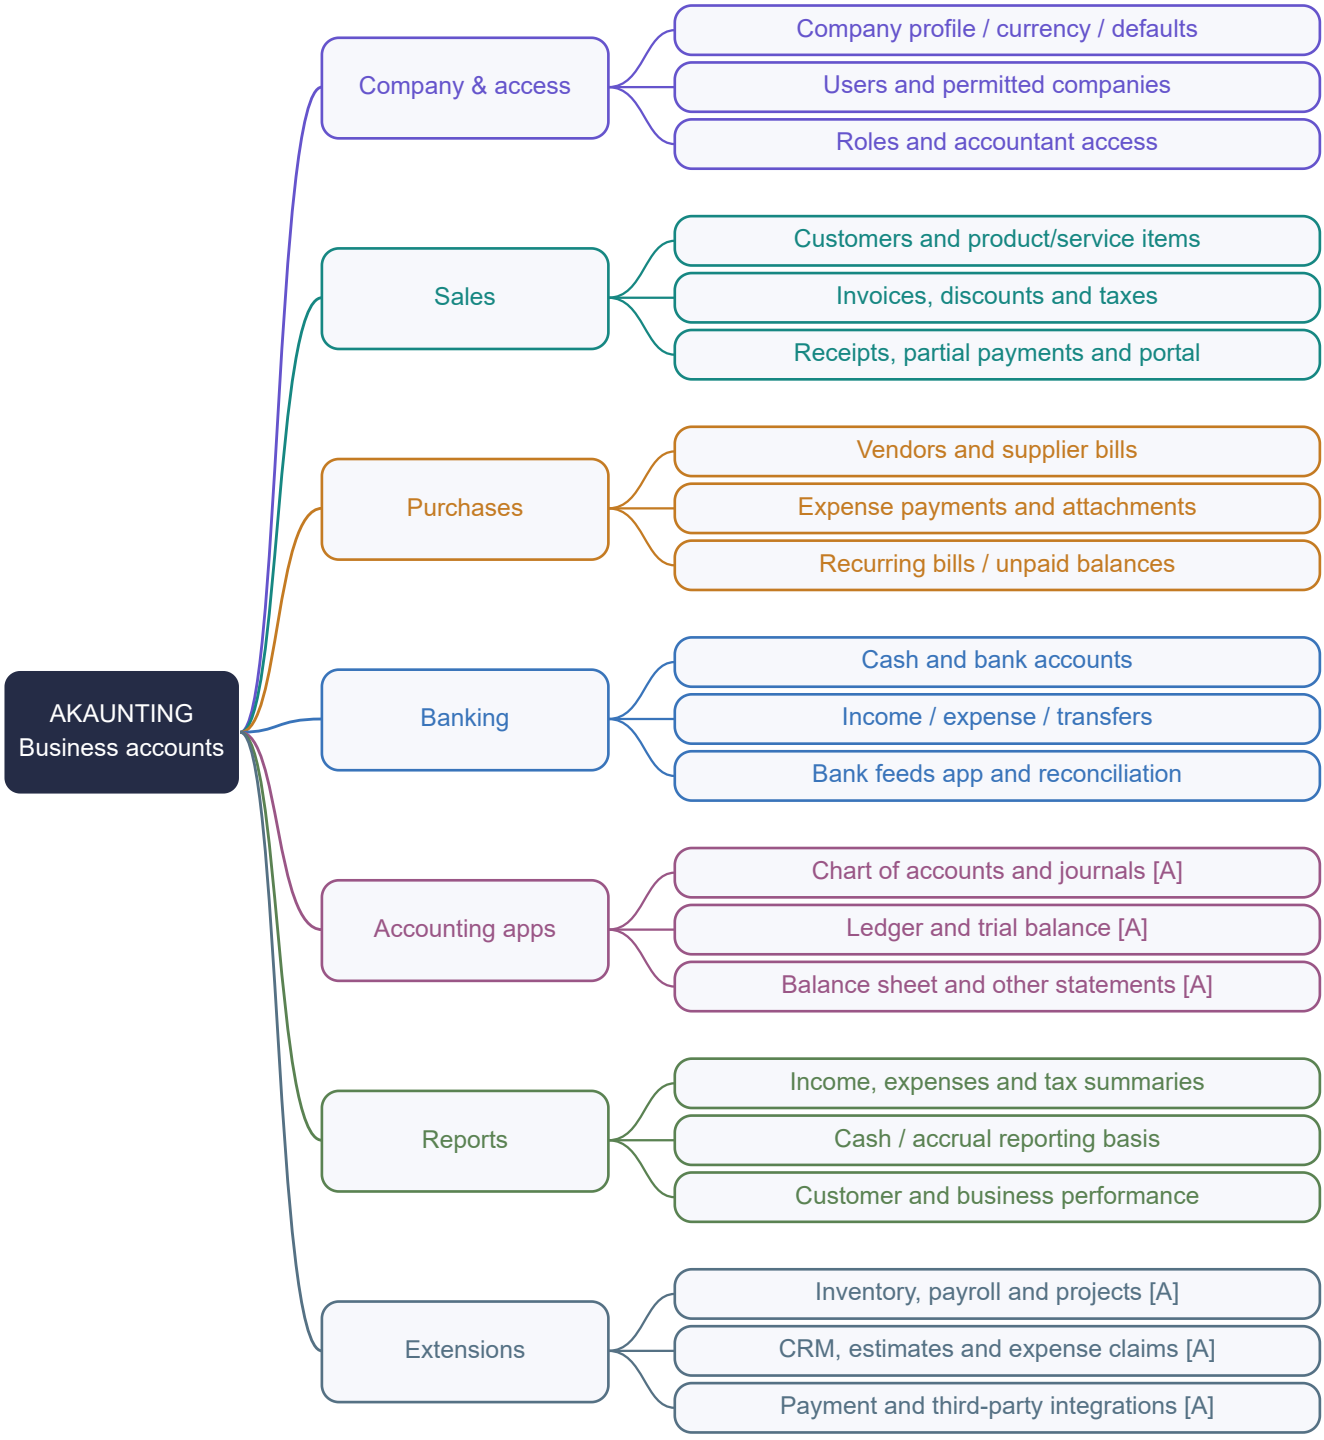

What is not assumed

No claim is made that every feature is free, installed in your account or supported by every bank. Exact pricing, user limits and app bundles must be checked against the selected subscription. The pricing page could not be reliably retrieved during this review.

Sources: [1] Product features, [18] Cloud versus self-hosted, [19] Cloud sign-in

02 / Feature tree

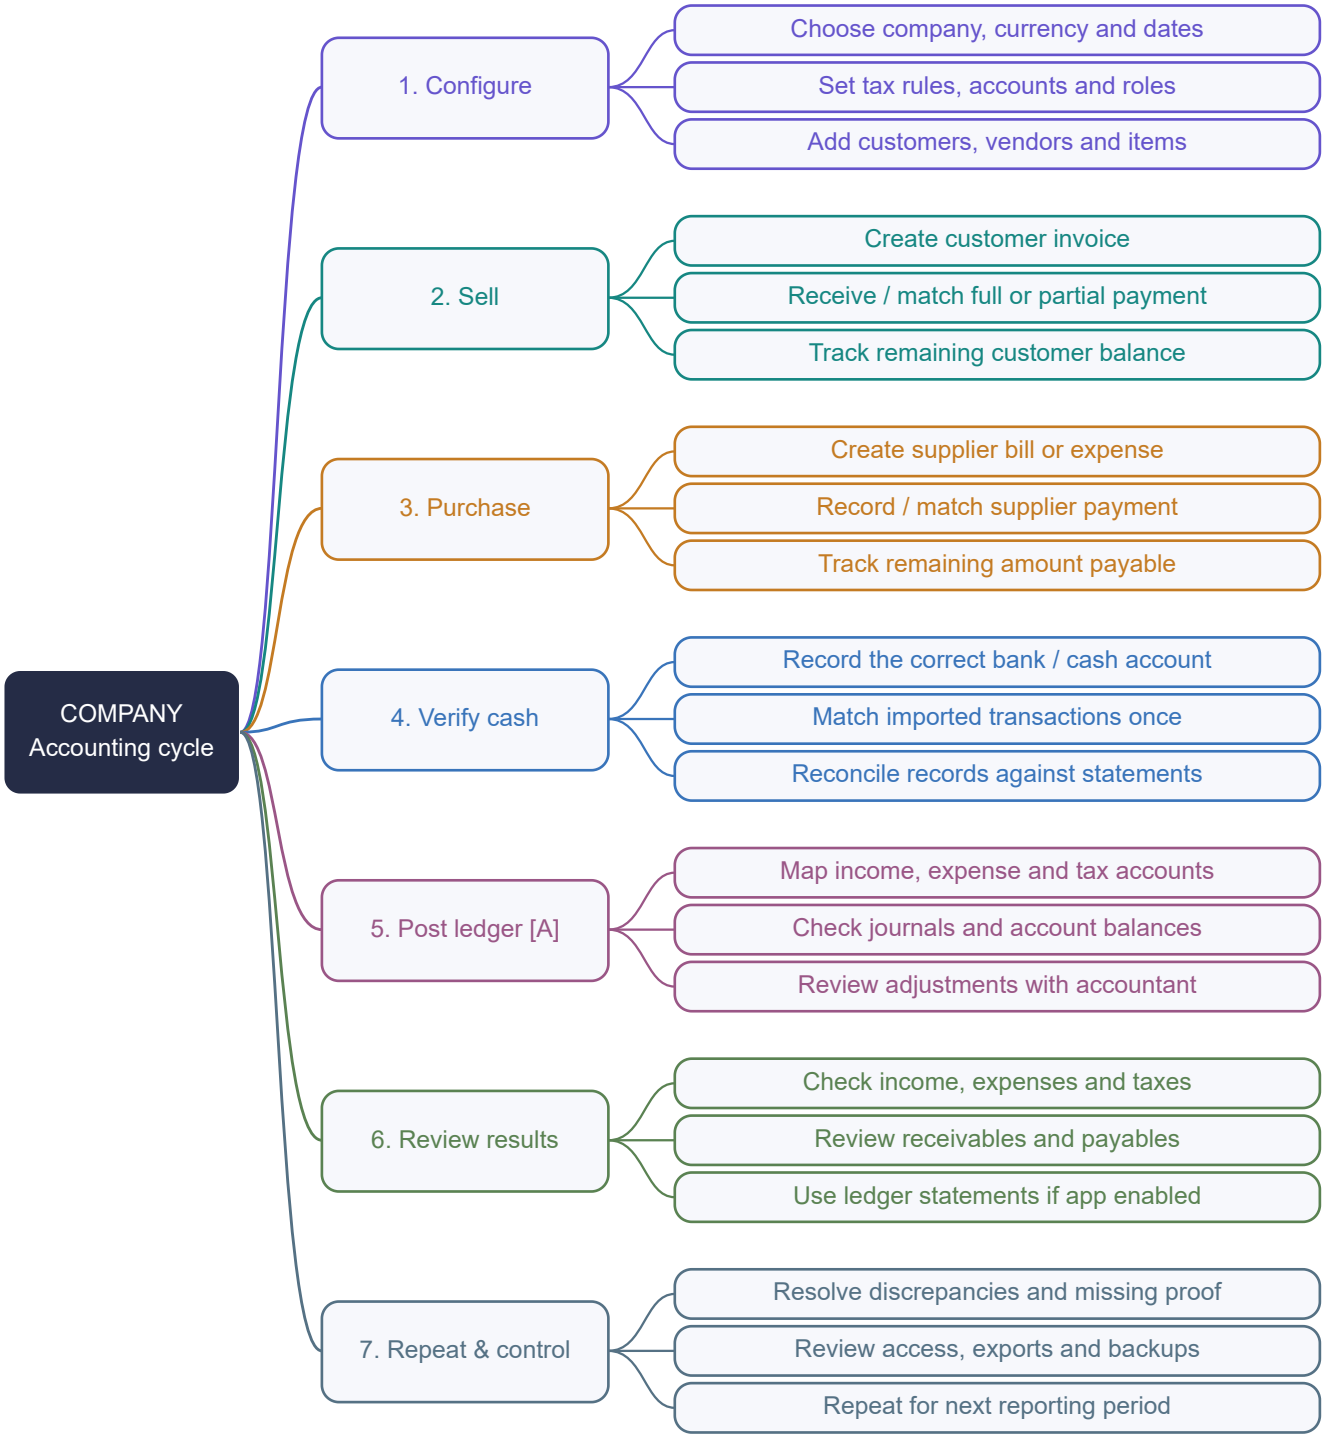

A conceptual map of the product, rather than a literal copy of its menu. [A] marks optional or app-dependent branches.

Start with the business records; add specialist apps only when needed. Sources [1, 2, 9, 10, 16, 17].

03 / Accounting workflow tree

Follow the transaction from setup to payment, verification and reporting. This diagram is an explanatory synthesis of the documented workflows.

An invoice or bill and its payment are related records. Creating one does not mean the other has happened. Sources [3-12]; controls in step 7 are recommendations [E].

04 / Sales: from invoice to receipt

Customers and invoices [F]

Create a customer, choose the invoice date and reference, then add products or services with descriptions, quantities and rates. Apply configured taxes and eligible line or overall discounts. Notes, categories and attachments provide context. Save and send the invoice through the available delivery options. [3]

Receiving money [F]

Record payment against the invoice using the actual receipt date, payment account and method. Payments can be full or partial. A remaining balance is still owed by the customer; an invoice should not be treated as fully settled merely because it was sent. [4]

Record	Purpose	Example [E]
Customer	Who is buying	Cedar Retail
Invoice	What they owe	Services: Rs 100,000
Payment / receipt	Money actually received	Rs 60,000 into bank
Outstanding balance	Amount still to collect	Rs 40,000

> **Practical check [E]:** when a bank receipt already exists, connect it to the invoice rather than recording the same receipt twice.

Related capabilities

The client portal exposes customer-facing records. Recurring documents support repeat billing. Estimates are a separate capability whose app/plan availability should be checked. [1, 17]

Sources: [3] Creating an invoice, [4] Invoice payments, [1] Product features, [17] Apps and integrations

05 / Purchases: bills and expenses

Supplier bills [F]

A bill records a supplier obligation. Choose the vendor and document date, enter the bill reference, add items, prices and applicable taxes or discounts, and attach supporting evidence. Categories and notes help explain the cost. [5]

Payment versus obligation [F]

Record the supplier payment against the bill, including the payment account, amount and date. Partial payments leave an unpaid balance. Direct expenses can instead represent spending that is recorded without a separate supplier bill. [6, 7]

Situation	Record to consider	Control [E]
Supplier allows payment later	Bill, followed by payment	Keep due date and unpaid amount visible
Expense paid immediately	Direct expense or paid bill	Do not record both for one cost
Part-payment to supplier	Payment against existing bill	Check the remaining balance
Regular rent or service charge	Recurring bill where available	Review amount before paying

Worked example [E]

A supplier bill is Rs 30,000. The business pays Rs 20,000 from its bank account. The payment reduces the amount owed to Rs 10,000. The bill total remains Rs 30,000; the payment is not another purchase.

Sources: [5] Creating a bill, [6] Bill payments, [7] Bank transactions

06 / Banking and money movements

Accounts and transactions [F]

Cash and bank accounts identify where money is held. Income and expense transactions record the date, method, account, amount, category and reference. Existing money movements may be connected to matching invoices or bills, including partial-payment situations. [1, 7]

Movement	Plain-language meaning	Recording check [E]
Income receipt	Money coming into an account	Identify the customer or reason
Expense payment	Money leaving an account	Identify the supplier or reason
Account transfer	Money moved between own accounts	Do not treat the transfer as a new sale
Opening balance	Money already held at the starting date	Verify against the migration cutoff

Bank feeds [A]

The Bank Feeds app can synchronize transactions from supported institutions. The official help page lists the US, Canada, Australia, New Zealand, UK and EU. Do not assume Pakistani bank connectivity; confirm the specific institution and current provider coverage. Manual transaction entry remains a separate workflow. [8]

Reconciliation [E]

Compare the bank statement with recorded money movements. Investigate duplicates, missing fees, wrong dates and incorrect amounts before relying on cash balances. A feed imports information; it does not remove the need for review.

Sources: [1] Product features, [7] Bank transactions, [8] Bank feeds

07 / The accounting layer

Double-entry is a separate capability [A]

The Chart of Accounts feature requires the Double-Entry app. Accounts can have a code, classification and parent account. The main classifications cover assets, liabilities, equity, income and expenses. The app adds ledger-oriented accounting, including journal and statement capabilities. [9, 10]

Account family	What it represents	Illustrative account [E]
Assets	Resources the business owns	Bank, customer receivables
Liabilities	Amounts the business owes	Supplier payables
Equity	Owner interest in the business	Owner capital
Income	Value earned by the business	Service revenue
Expenses	Costs incurred	Rent, office supplies

Cash versus accrual [F]

Akaunting documents accrual-based accounting and a cash option in reports. Accrual looks at when income is earned or costs are incurred; cash looks at receipt and payment timing. Results can differ even for the same period. Confirm the basis selected before comparing reports. [11]

> **Illustration [E]:** invoice Rs 100,000; receipt Rs 60,000. Ignoring taxes and other adjustments, the earned amount and cash received are different. A debit/credit example appears on page 13.

Sources: [9] Chart of accounts, [10] Double-Entry app, [11] Cash versus accrual

08 / Reports: what each answers

Report names appear in the official catalogue, but their availability depends on the installed apps and plan. A catalogue entry alone does not mean it is included in the basic application. [12]

Report / view	Question it answers	Availability note
Income summary	Where did recorded income come from?	Documented reporting
Expense summary	Where are recorded costs concentrated?	Documented reporting
Income versus expense	How do the two totals compare?	Documented reporting
Tax summary	What tax amounts were recorded?	Configuration and report dependent
Customer statement	What activity belongs to this customer?	Check plan/report availability
Profit and loss	What is the accounting result for a period?	Check basis and accounting app
Balance sheet	What are assets, liabilities and equity?	Double-Entry related [A]
Trial balance	What are debit/credit balances by account?	Double-Entry related [A]
General ledger	What entries make up account balances?	Double-Entry related [A]
Cash flow statement	How did cash change across activities?	Check app/report availability

Read reports consistently [E]

Use the same company, reporting dates, currency treatment and cash/accrual basis. Trace an unexpected total back to its underlying records. A tax summary is not proof that a tax return has been filed or accepted.

Sources: [12] Reports catalogue, [10] Double-Entry app, [11] Cash versus accrual

09 / Users, companies and access

Documented roles include Accountant, Customer, Employee and Manager, with Admin also listed for the self-hosted edition. The cloud and self-hosted role models are not identical. The help page states that on-premise role management requires the Roles & Permissions app. [13]

Recommended access design [E]

Person	Appropriate working scope	Avoid granting automatically
Business owner	Oversight of permitted companies	Unrestricted access to unrelated entities
Accountant	Financial records and accounting reports	Infrastructure administration without need
Accounts operator	Prepare invoices, bills and receipts	Uncontrolled accounting adjustments
Manager	Relevant oversight and approved actions	Full access merely because of job title
Employee	Their permitted employee workflows	Whole-company financial information
Customer	Their own portal records	Other customers or internal records

Company separation [F / E]

Akaunting supports multiple businesses and company assignments. Treat company selection as a data boundary. Before rollout, test whether each role can view, create, edit, delete and export the intended records. The matrix above is a recommended policy, not a reproduction of Akaunting defaults.

Sources: [13] Roles and permissions, [1] Product features

10 / Setup and configuration

Business setup checklist [E]

- Choose cloud or self-hosting and identify the accountable administrator.
- Create the business profile and confirm the default currency and reporting dates.
- Set invoice identity, numbering conventions and customer-facing text.
- Add cash/bank accounts and agree opening balances at a single cutoff date.
- Prepare customer, vendor and product/service lists.
- Configure named tax rates and review how they apply to transactions.
- Map categories; add ledger accounts if Double-Entry is installed.
- Assign company access and permitted roles before inviting the wider team.

Tax configuration [F]

Akaunting documents creation and management of tax rates. Configure the intended rate and type before applying them to items or documents. Do not assume that choosing a tax label implements every local reporting or filing rule. [14]

Products and services [F / A]

Items provide reusable names, descriptions and prices for billing and purchasing. Stock quantities, warehouses and inventory operations belong to the Inventory app scope; a basic item list is not a full stock-control system. [15, 16]

> **Illustration only:** all rupee amounts in this guide are examples. No statutory tax percentage, local filing integration or regulatory compliance has been assumed.

Sources: [14] Tax rates, [15] Products and services, [16] Inventory app, [2] Documentation index

11 / Optional apps and deployment

Akaunting distinguishes native feature apps from third-party integrations. Installing or purchasing an app can extend the menus and workflow. These extensions should be scoped separately from everyday invoicing and bill entry. [17]

App area [A]	Business purpose	What to verify
Double-Entry	Accounts, journals and financial statements	Availability, account mappings and opening entries
Inventory	Warehouses, variants and stock operations	Quantity rules and accounting integration
Estimates / quotes	Proposals before invoicing	Conversion and document behaviour
Payroll / employees	Pay calendars and payslips	Country-specific suitability
Projects / CRM	Project work and customer pipeline	Overlap with existing business systems
Expense claims	Employee claim and approval workflows	Approval scope and payment handling
Payment integrations	Online collection	Provider coverage, fees and settlement
Bank Feeds	Bank transaction synchronization	Supported country and institution

Cloud or self-hosted?

Cloud uses Akaunting-hosted infrastructure; self-hosting places the application on infrastructure you operate. For self-hosting, plan for deployment, updates, restore testing and maintenance. Check the current subscription and app terms for either route rather than relying on broad free-software marketing. [18]

12 / One complete accounting example

Illustrative double-entry explanation [E]. Assumes the Double-Entry capability, accrual accounting, no tax, one currency and no inventory.

Event	Business record	Illustrative accounting effect
1. Invoice customer Rs 100,000	Customer invoice	Debit receivables 100,000; credit revenue 100,000
2. Receive Rs 60,000	Payment linked to invoice	Debit bank 60,000; credit receivables 60,000
3. Supplier bill Rs 30,000	Expense bill	Debit expense 30,000; credit payables 30,000
4. Pay supplier Rs 20,000	Payment linked to bill	Debit payables 20,000; credit bank 20,000

Result after these four events

Measure	Amount	Meaning
Revenue earned	Rs 100,000	Does not mean all cash was received
Expense incurred	Rs 30,000	Does not mean all cash was paid
Illustrative profit	Rs 70,000	100,000 less 30,000
Net bank movement	Rs 40,000 increase	60,000 received less 20,000 paid
Customer balance	Rs 40,000 receivable	Still to collect
Supplier balance	Rs 10,000 payable	Still to pay

> Profit and cash movement differ. The invoice, receipt, bill and payment each describe a different part of the same business activity. This example explains the concepts; it is not a guarantee of automatic posting under every configuration.

13 / Operating checklist and glossary

Recommended routine [E]

When	Review
Daily	Enter new documents; record receipts/payments; attach evidence; check overdue items.
Weekly	Match bank movements; resolve duplicate or unconnected records; review customer/supplier balances.
Monthly	Reconcile accounts; check cash/accrual basis; review statements and unusual postings; retain exports.
When access changes	Remove unnecessary company permissions and verify customer/employee isolation.
Before an app or major update	Confirm compatibility, test critical workflows and check the recovery plan.

Plain-language glossary

Term	Meaning
Invoice	Document requesting customer payment.
Bill	Supplier document recording what the business owes.
Receivable / payable	Amount to collect / amount to pay.
Payment account	The cash or bank account used for a money movement.
Category / ledger account	A business grouping / a formal accounting classification. They are not interchangeable.
Journal / ledger	Balanced accounting entry / history grouped by account.
Reconciliation	Comparing recorded activity with external evidence, usually a statement.
Accrual / cash basis	Recognition by earning/incurring / recognition by receiving/paying.

Concept definitions and routines are explanatory material, not a claim that every control has a dedicated Akaunting screen.
